CheckInFromFileSystem

Punkte: 3

I'm trying to send request to /DocuWare/Platform/FileCabinets/{fileCabinetId}/Documents/{id}/CheckInFromFileSystem using Postman with body and headers as seen on attached screenshots - "wrong headers.png" and "wrong body.png". As a response from server I am receiving an error:

```
<?xml version="1.0" encoding="utf-8"?>
<?xml-stylesheet type="text/xsl" href="/DocuWare/Platform/Content/errors.xslt"?>
<s:Error Uri="http://domain.tld/DocuWare/Platform/FileCabinets/ea8428fd-637f-459c-970d... (http://domain.tld/DocuWare/Platform/FileCabinets/ea8428fd-637f-459c-970d-9ca9c94b361c/Documents/58/CheckInFromFileSystem)" Method="POST"
```

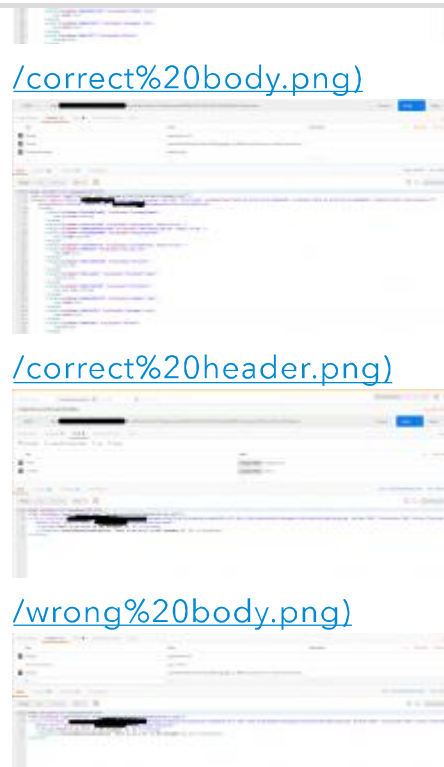

```
2).</s:Exception>
</s>Error>
```

Attached file "test.txt" contains unstructured lorem ipsum and content of metadata.xml is:

```
<?xml version="1.0" encoding="utf-8"?>
<Document xmlns="http://dev.docuware.com/schema/public/services/platform">
(http://dev.docuware.com/schema/public/services/platform>)
  <Fields>
    <Field FieldName="ACQUIREDFROM">
      <String>Me</String>
    </Field>
  </Fields>
</Document>
```

On the other hand, while sending similar request (with same metadata.xml and same test.txt) to: /DocuWare/Platform/FileCabinets/{fileCabinetId}/Documents we are receiving correct response ("correct body.png" and "correct headers.png"), which would mean, that despite of an error the XML file is correct.

1. Why does one endpoint accept the XML file, that second one does not?
2. What has to be changed in our request to make it correct?
3. Is there any correct curl request sample?

Konrad,

Konrad,

Punkte: 490

I have found XML construction to be a bit finicky when I am using Visual Foxpro and the ServerXMLHTTP request object. In some XML I have that looks similar to yours (defining "Field"

Let's see if I have a longer <Document> example...here's one:

```
<?xml version="1.0" encoding="utf-8"?>
<?xml-stylesheet type="text/xsl" href="/DocuWare/Platform/Content/standard.xslt"?>
<Document xmlns:s="http://dev.docuware.com/schema/public/services"
(http://dev.docuware.com/schema/public/services) xmlns="http://dev.docuware.com/schema/public/services/platform"> (http://dev.docuware.com/schema/public/services/platform>)
  <Fields>
    <Field FieldName="{fieldname}">
      <{fieldtype}>{value}</{fieldtype}>
    </Field>
  </Fields>
</Document>
```

It looks like you might be lacking the second line in the XML headers, the one that establishes stylesheet type?

If you are more familiar/comfortable with JSON, you might try that. It seems easier to construct, but I did not have much luck with it. But maybe I was not setting my request headers appropriately. JSON seems to be the thing a lot of web-based services are leaning towards, though DocuWare still stores a LOT of stuff as XML in their back-end database (like embedded properties).

Hope this helps. Getting Playform Service stuff working in anything other than .NET has always been a struggle from what I see on the forums.

Thanks,

Oben

Dear,

Punkte: 25

Dear,

I'm also struggling with Postman and the lack of documentation for the sdk. What I'm doing is using 'Fiddler'. Try to do a check in from the webclient and you can see the Xml used by Docuware within Fiddler.

I've done this for updating fields using Postman & Curl. It's take some times, but you will have a good idea what Docuware platform is waiting as xml.

Kind Regards

Oben

([auf Beitrag #4 antworten](#)) ([/de/forum/english-forums/docuware-help-technical-problems](#)

That is a great tip. I recall using something to try to see what the web client was doing, but now I cannot remember the tool. I will take a look at Fiddler.

Thanks,

Joe Kaufman

JSON

Punkte: 490

Benoit,

I have Fiddler up and running and it is showing me traffic to our DocuWare server (6.11 running on-premise, straight HTTP), but I am not seeing any XML. The XML pane is always empty, and instead, JSON is populated.

How are you getting the web client to communicate via XML when doing something like changing an index field? All I see is JSON...

Correct XML Syntax for CheckInFromFileSystem

Punkte: 2

Hi Konrad,

the correct syntax for your xml file for CheckInFromFileSystem is like this:

```
<?xml version="1.0" encoding="utf-8"?>
<?xml-stylesheet type="text/xsl" href="/DocuWare/Platform/Content/standard.xslt"?>
<CheckInActionParameters Comments="test comment" xmlns:s="http://dev.docuware.com/schema/public/services"
xmlns="http://dev.docuware.com/schema/public/services/platform">
  <CheckInReturnDocument>
    <String>CheckedIn</String>
  </CheckInReturnDocument>
</CheckInActionParameters>
```

The String for CheckInReturnDocument could be "CheckedIn" or "Original".
In Comments attribute you can save a comment to your checked in new file.

Be sure you have post a CheckoutDocument to that document before you post a new checkin .
Otherwise you get an error like this:

Best Regards

Patrick
